Abstract

Based on the Adomian decomposition method and the Taylor formula, a segmented Adomian approximate solution of the heterogeneous aquifer model on the triangular groundwater flow region is provided. A new Adomain algorithm is provided for (initial) boundary value problem of the second order partial differential equation on the triangular region.

1. 引言

目前为止, 研究人员们提出并发展了很多求解偏微分方程的方法, 如 Lie 对称[1] [2]、Adomian 分解法[3]、同伦摄动法[4] [5]、同伦分析法[6]、精确解方法[7] [8]等等。这些方法中, Adomian 分解法(Adomian Decomposition Method-ADM)是由美国数学物理学家 Georgie Adomian [3]教授提出并发展起来的一种方法。该方法中假定方程的因变量和非线性项都能分解为级数。非线性项的分解式被称为 Adomian 多项式, 段[9] [10]研究了 Adomian 多项式的计算方法的优化。Cherrault [11]等人研究了 Adomian 分解法的收敛性问题。Wazwaz [12]基于 Adomian 分解法考虑了奇异初值问题; D. Lesnic [13]基于 Adomian 分解法考虑了广义 Boussinesq 问题; 朱永贵[14]给出了 Adomian 逆算符方法, 通过实现该算法的算例, 验证了 Adomian 分解法的有效性。

Shidfar [15]和 Patel [16]等人基于 Adomian 分解法针对矩形区域对应的偏微分方程的(初)边值问题进行研究, 并提出了不同的算法。我们[17]对矩形区域对应的偏微分方程的(初)边值问题提出了分段带权 Adomian 分解法。

本文中基于 Adomian 分解法考虑三角形区域对应的偏微分方程的边值问题, 即三角形地下水水流区域上的异质含水层模型。地下水水流区域上的异质含水层模型控制微分方程为:

$$\frac{\partial}{\partial x} \left(T(x, y) \frac{\partial h(x, y)}{\partial x} \right) + \frac{\partial}{\partial y} \left(T(x, y) \frac{\partial h(x, y)}{\partial y} \right) = -R_g, \quad 0 \leq x \leq 600, \quad 0 \leq y \leq x \quad (1)$$

其中 $h(x, y)$ 是水头函数[L]; $R_g = 10^{-2}$ 表示月平均降雨补给 [LT^{-1}]; $T(x, y) = 500 - 0.2x - 0.1y$ 表示含水层渗透系数 [L^2T^{-1}]。设附加边界条件为

$$h(600, y) = f_1(y) \quad (2)$$

斜边 $y = x$ 上:

$$h(x, x) = f_2(x) \quad (3)$$

$$h(x, 0) = f_3(x) \quad (4)$$

其中 $f_1(y) = -\frac{y^2}{450000} + \frac{3y}{1000} + 102$, $f_2(x) = -\frac{x^2}{125000} + \frac{49x}{5000} + 100$, $f_3(x) = -\frac{3x^2}{500000} + \frac{13x}{1875} + 100$ 。

2. 地下水流区域上的异质含水层模型的分段 Adomian 近似解

将方程(1)改写成

$$L_x h + L_y h = -\frac{R_g}{T(x,y)} - \frac{1}{T(x,y)} \frac{\partial T}{\partial x} \frac{\partial h}{\partial x} - \frac{1}{T(x,y)} \frac{\partial T}{\partial y} \frac{\partial h}{\partial y}, \quad 0 \leq x \leq x_{\max}, 0 \leq y \leq x \quad (5)$$

其中, $L_x = \frac{\partial^2}{\partial x^2}$, $L_y = \frac{\partial^2}{\partial y^2}$ 。

步骤 1: 利用直线 $x=c$ 与 $y=c$ 先将区域 $0 \leq x \leq 600, 0 \leq y \leq x$ 划分成如下三块, 如图 1 所示

$$\begin{aligned} & 0 \leq x \leq 100, 0 \leq y \leq x; \\ & 100 \leq x \leq 600, 0 \leq y \leq 100; \\ & 100 \leq x \leq 600, 100 \leq y \leq x; \end{aligned} \quad (6)$$

步骤 2: 在 $0 \leq x \leq 600, 0 \leq y \leq x$ 上, 在方程(5)两侧作用于

$$L_x^{-1} = \int_y^x \int_y^x (\cdot) dx dy - \frac{x-y}{600-y} \int_y^{600} \int_y^x (\cdot) dx dy$$

考虑边界条件 $h(600, y) = f_1(y)$, $h(y, y) = f_2(y)$, 并令 $h = \sum_{n=0}^{\infty} h_n$ 后得到

$$\begin{aligned} \sum_{n=0}^{\infty} h_n &= f_2(y) + \frac{x-y}{600-y} (f_1(y) - f_2(y)) - L_{x1}^{-1} L_y \sum_{n=0}^{\infty} h_n \\ &\quad - L_{x1}^{-1} \left(\frac{R_g}{T(x,y)} + \frac{1}{T(x,y)} \frac{\partial T}{\partial x} \frac{\partial h}{\partial y} + \frac{1}{T(x,y)} \frac{\partial T}{\partial y} \frac{\partial h}{\partial y} \right) \end{aligned} \quad (7)$$

将函数 $\frac{1}{T(x,y)}$ 在原点 Taylor 展开, 并记为: $\frac{1}{T(x,y)} = t_1 + \sum_{k=2}^{\infty} t_k$ 其中

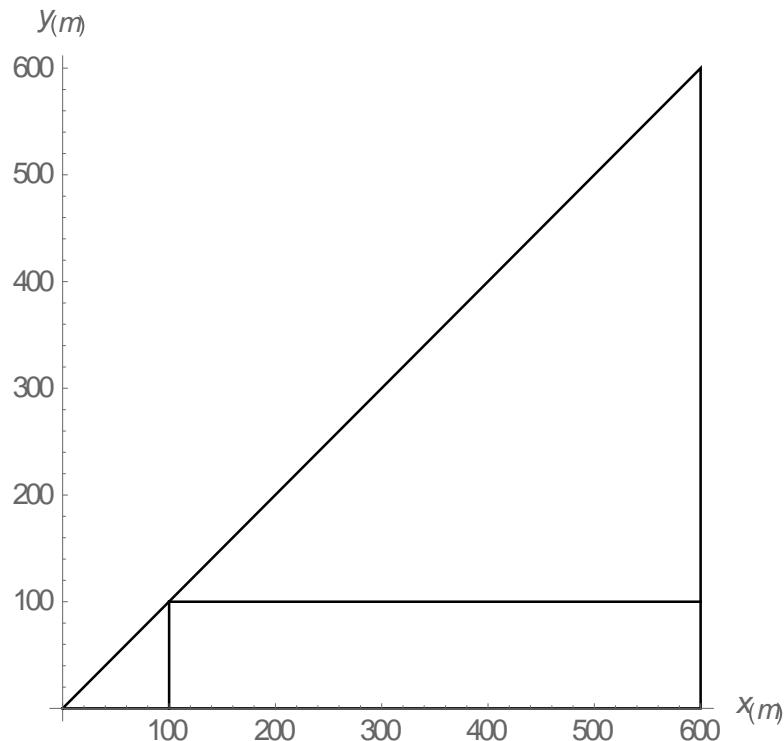

Figure 1. Segmented area
图 1. 分段区域

$$t_k = \frac{1}{k!} \left(x \frac{\partial}{\partial x'} + y \frac{\partial}{\partial y'} \right)^k \frac{1}{T(x', y')} \Big|_{x'=0, y'=0}, \quad k \geq 2$$

那么，有

$$\frac{1}{T(x,y)} \frac{\partial h}{\partial x} = \sum_{i=1}^{\infty} \sum_{j=0}^{i-1} t_{i-j} \frac{\partial h_j}{\partial x} \quad (8)$$

$$\frac{1}{T(x,y)} \frac{\partial h}{\partial y} = \sum_{i=1}^{\infty} \sum_{j=0}^{i-1} t_{i-j} \frac{\partial h_j}{\partial y} \quad (9)$$

由此，根据(7)-(9)构造循环公式，如下：

$$h_0 = f_2(y) + \frac{x-y}{600-y} (f_1(y) - f_2(y)) - L_{x1}^{-1} R_g t_1,$$

$$h_n = -L_{x1}^{-1} L_y h_{n-1} - L_{x1}^{-1} R_g t_{n+1} - L_{x1}^{-1} \left(\frac{\partial T}{\partial x} \sum_{j=0}^{n-1} t_{n-j} \frac{\partial h_j}{\partial x} + \frac{\partial T}{\partial y} \sum_{j=0}^{n-1} t_{n-j} \frac{\partial h_j}{\partial y} \right), \quad n = 1, 2, \dots$$

从这个循环公式得到

$$h_0 = 100 + \frac{92x}{9375} - \frac{x^2}{100000} - \frac{x^3}{7500000000} - \frac{y}{75000} + \frac{7xy}{1125000} \\ - \frac{x^2y}{5000000000} - \frac{19y^2}{4500000} - \frac{xy^2}{3000000000}$$

$$h_1 = -\frac{9919x}{4687500} + \frac{19x^2}{4500000} - \frac{531x^3}{625000000000} - \frac{83x^4}{168750000000000} \\ - \frac{x^5}{2500000000000000} + \frac{9919xy^2}{4687500} - \frac{98413xy}{28125000000} + \frac{1471x^2y}{3750000000000} \\ - \frac{119x^3y}{1687500000000000} - \frac{19x^4y}{4500000000000000} - \frac{6779y^2}{9375000000} + \frac{7697xy^2}{56250000000000} \\ - \frac{x^2y^2}{3125000000000000} + \frac{x^3y^2}{12500000000000000} - \frac{10249y^3}{11250000000000000} + \frac{9709xy^3}{67500000000000000} \\ + \frac{x^2y^3}{7500000000000000} + \frac{59y^4}{7500000000000000} - \frac{59xy^4}{45000000000000000}$$

从而得到方程(5)与 $h(600, y) = f_1(y)$, $h(y, y) = f_2(y)$ 的 n 项 Adomian 近似解

$$H_1 = \sum_{i=0}^{n-1} h_i$$

步骤3: 在 $100 \leq x \leq 600, 0 \leq y \leq 100$ 上, 在方程(5)两边作用于算子

$$L_{y1}^{-1} = \int_0^y \int_0^y (\cdot) dy dy - \frac{y}{100} \int_0^{100} \int_0^y (\cdot) dy dy$$

同时考虑边界条件 $h(x,0) = f_3(x)$, $h(x,100) = H_1(x,100)$, 并令 $h = \sum_{n=0}^{\infty} h_n$ 后得到

$$\begin{aligned} \sum_{n=0}^{\infty} h_n &= f_3(x) + \frac{y}{100} (S_x(x, 100) - f_3(x)) - L_{y1}^{-1} L_x \sum_{n=0}^{\infty} h_n \\ &\quad - L_{y1}^{-1} \left(\frac{R_g}{T(x, y)} + \frac{1}{T(x, y)} \frac{\partial T}{\partial x} \frac{\partial h}{\partial y} + \frac{1}{T(x, y)} \frac{\partial T}{\partial y} \frac{\partial h}{\partial y} \right) \end{aligned}$$

根据(8)-(9), 构造循环公式

$$\begin{aligned} h_0^* &= f_3(x) + \frac{y}{100} (S_x(x, 100) - f_3(x)) - L_{y1}^{-1} R_g t_1, \\ h_n^* &= -L_{y1}^{-1} L_x h_{n-1}^* - L_{y1}^{-1} R_g t_{n+1} - L_{y1}^{-1} \left(\frac{\partial T}{\partial x} \sum_{j=0}^{n-1} t_{n-j} \frac{\partial h_j^*}{\partial x} + \frac{\partial T}{\partial y} \sum_{j=0}^{n-1} t_{n-j} \frac{\partial h_j^*}{\partial y} \right), n = 1, 2, \dots \end{aligned}$$

从这个循环公式得到(5)与 $h(x, 0) = f_3(x)$, $h(x, 100) = S_x(x, 100)$ 的 n 项 Adomian 近似解

$$H_2 = \sum_{i=0}^{n-1} h_i^*$$

其中 $100 \leq x \leq 600, 0 \leq y \leq 100$ 。

步 4: 在方程(5)两侧作用于 $L_{x2}^{-1} = \int_y^x \int_y^x (\cdot) dx dy - \frac{x-y}{100-y} \int_y^{100} \int_y^x (\cdot) dx dy$, 同时考虑

$$h(100, y) = S_Y(100, y), h(y, y) = f_2(y)$$

与公式(8)-(9), 并令 $h = \sum_{n=0}^{\infty} h_n$ 后获得

$$\begin{aligned} h_0^{**} &= f_2(y) + \frac{x-y}{600-y} (S_Y^*(100, y) - f_2(y)) - L_{x1}^{-1} R_g t_1, \\ h_n^{**} &= -L_{x1}^{-1} L_y h_{n-1}^{**} - L_{x1}^{-1} R_g t_{n+1} - L_{x1}^{-1} \left(\frac{\partial T}{\partial x} \sum_{j=0}^{n-1} t_{n-j} \frac{\partial h_j^{**}}{\partial x} + \frac{\partial T}{\partial y} \sum_{j=0}^{n-1} t_{n-j} \frac{\partial h_j^{**}}{\partial y} \right), n = 1, 2, \dots \end{aligned}$$

从这个循环公式得到(5)与 $h(100, y) = S_Y(100, y)$, $h(y, y) = f_2(y)$ 的 n 项 Adomian 近似解

$$H_3(x, y) = \sum_{i=0}^{n-1} h_i^*$$

其中 $0 \leq x \leq 100, 0 \leq y \leq x, n = 0, 1, 2$ 。

最后归纳以上部分解得到整个区域上的分段近似解, 如图 2 所示,

3. 结果分析

分段近似解 $H(x, y)$ 除了边界线 $y=0$ 和 $x=600$ 上的 $0 \leq x \leq 100, 0 \leq y \leq 100$ 两小段边界以外, $H(x, y)$ 精确满足其余的所有边界条件。为了表征 $H(x, y)$ 的近似程度, 令边界误差为

$$\widetilde{BE} = \int_0^{100} (S(x_{\max}, y) - f_1(y))^2 dy + \int_0^{100} (S(x, 0) - f_3(x))^2 dx$$

运用余函数来表示近似解在区域内任意一点处的误差

$$Error(h) = L_x h + L_y h + Rh + Nh + g(x, y)$$

利用 $\widetilde{EE} = \|Error(h(x, y))\|_2^2$ 表征近似解的方程误差, 其中 $\|\cdot\|$ 是 L^2 范数。本文中得到的三项分段近似解 $H(x, y)$ 的边界误差和方程误差分别为 $\widetilde{BE} = 0.00197521$, $\widetilde{EE} = 1.64279 \times 10^{-6}$ 。
