Abstract: Using one known series, we can structure several new alternated with positive and negative Series of reciprocals of binomial coefficients by splitting items. These denominators of series contains different the multiplication of one to five odd factors and binomial coefficients. And some identities of series of numbers values of reciprocals of binomial coefficients are given. The method of split items offered in this paper is a new combinatorial analysis way and an elementary method to construct new series.

1. 引言

二项式系数倒数变换问题在组合数学, 解析数学等学科研究领域极为重要, 引起了很多学者的广泛关注^[1-7]。在文献[2-5]中, 他们利用被称为 Lehmer 级数恒等式 $\sum_{n=1}^{\infty} \frac{(2x)^{2n}}{n \binom{2n}{n}} = \frac{2x \arcsin x}{\sqrt{1-x^2}}$, $|x|<1$ 。使用积分, 发生函

数, 白塔 - 伽马函数, 递推等数学工具得到二项式系数倒数级数的重要结果。文献[1-6]的二项式系数倒数级数的和式是用积分形式表示的。显然, 级数的和式不是封闭形式。要得到级数明显表达式还要进行积分运算。我们利用文献[8]中级数恒等式 $\sum_{n=0}^{\infty} (-1)^n \frac{(n!)^2 4^n x^{2n+1}}{(2n+1)!} = \frac{\ln(x + \sqrt{1+x^2})}{\sqrt{1+x^2}}$, 通过裂项构造出一批新的正负相间二项

式系数倒数级数, 它们的分母分别含有1到5个奇因子与二项式系数的乘积表达式。所给出正负相间二项式系数倒数级数的和式是封闭形的。另外, 在定理中, 令 $x=\frac{1}{2}$, 或 $x=\frac{1}{2\sqrt{2}}$, 给出了一些二项式系数倒数值级数恒

等式。因此, 由此看出, 利用已知级数使用裂项的方法研究二项式系数倒数变换是组合分析的新手段, 也是产生新级数的一个初等方法。
