## Abstract

This paper considers the issues of the switching state strategy memory feedback for a class of uncertain Singular Lurie switched systems with multiple time-varying delays. Under the circumstances of a state-based switching law, and based on the Lyapunov-Krasovskii functional techniques, Schur complement lemma, and linear matrix inequality, the sufficient conditions are given for the asymptotic stability and strictly passive of uncertain switched singular systems with multiple time-varying delays. Meanwhile, robust passive controllers for each subsystem under the switching law are designed. It is believed that controller with memory should provide more freedom for robust stability analysis and synthesis controller for the systems. In the final, the results are given in the form of linear matrix inequalities (LMIs). And the validity of the conclusion is shown by numerical examples.

## 摘要

本文在基于Lyapunov-Krasovskii泛函、Schur补引理及矩阵不等式方法下, 讨论了一类具有不确定性多状态变时滞广义Lurie切换系统, 在切换状态反馈策略下, 得到了使不确定多状态变时滞Lurie切换广义系统能够渐近稳定且严格无源存在的充分性判据, 为系统的综合提供了可行性判据。设计了具有记忆的反馈控制器, 为系统的稳定性分析及控制器的综合提供了更多的自由度, 最后的结果转化为线性矩阵不等式给出, 通过数值仿真, 验证了定理的有效性和实用性。

## 1. 引言

切换系统是由一族子系统和描述它们之间联系的切换规则组成的混杂系统[1]。切换系统在实际工程系统中应用很广泛, 如通讯系统、电力系统、航空航天系统、化工系统、经济系统、交通系统、网络控制系统等[2] [3] [4], 近年来, 切换系统已经成为广大学者的研究热点[5]-[16], 而带有记忆的控制器的引入更加符合实际, 且为控制的可行性提供更好的自由度, 因而对此类问题的研究更具有实际应用及理论价值。文献[17]对线性切换系统的稳定性分析进展进行了综述。文献[18]利用广义 Lyapunov 方法研究了一类具有多状态不确定性的切换广义系统的鲁棒无源控制问题。文献[19]利用 Lyapunov-Krasovskii 泛函研究了一类时变时滞的不确定性 Lurie 动态输出反馈  $H_\infty$  控制问题。文献[20]研究了切换广义系统的  $H_\infty$  静态输出反馈和动态输出反馈问题。文献[21]通过构造 Lyapunov-Krasovskii 泛函, 研究了一类带有多时滞摄动下的非线性切换系统的稳定性分析和切换律的设计问题。文献[22]通过引入新颖的 Lyapunov-Krasovskii 泛函, 分析了非线性切换延迟系统的问题。A. V. Platonov 在文献[23]中研究了一类非线性切换系统的稳定性问题。文献[24]通过构造状态采样数据控制器, 考虑了一类切换非线性系统的异步切换下的全局镇定问题。在文献[25]中王荣豪等人对具有异步切换的非线性切换系统的有限时间稳定性和稳定性问题进行了研究。

现有的文献中, 很少有涉及到多状态变时滞广义 Lurie 切换系统反馈问题, 为此本文将研究具有参数不确定性时变时滞多状态 Lurie 切换广义系统的无源控制问题, 通过运用 Lyapunov-Krasovskii 泛函、线性矩阵不等式以及文献[26] [27]所提供的不等式, 进一步考虑了带有记忆的鲁棒无源控制的综合问题。考虑带有记忆的控制器可以使系统的稳定性分析及控制综合拥有了更多的自由度及更好的合理性。并利用线性矩阵不等式形式得到了 Lurie 切换广义系统渐近稳定且严格无源的充分条件。

## 2. 系统的描述和准备

考虑以下含参数不确定性的带有记忆的变时滞广义 Lurie 切换系统:

$$\begin{cases} E\dot{x}(t) = \left( A_{\sigma(t)} + \Delta A_{\sigma(t)}(t) \right) x(t) + \left( A_{1\sigma(t)} + \Delta A_{1\sigma(t)}(t) \right) x(t - d_1(t)) \\ \quad + \left( A_{2\sigma(t)} + \Delta A_{2\sigma(t)}(t) \right) x(t - d_2(t)) + B_{1\sigma(t)} u(t) + B_{2\sigma(t)} \omega(t) + Df(\mu(t)) \\ z(t) = C_{\sigma(t)} x(t) + C_{1\sigma(t)} u(t) + C_{2\sigma(t)} \omega(t) \\ \mu(t) = Cx(t) \\ x(t) = \varphi(t) \in C([-d, 0], R^n) \end{cases} \quad (1)$$

其中,  $x(t) \in R^n$  为系统的被控对象状态变量,  $u(t) \in R^p$  为控制输入状态变量,  $z(t) \in R^m$  为控制输出变量,  $\sigma(\cdot) : [0, \infty] \rightarrow \{1, 2, \dots, N\} = \bar{N}$  为分段常值切换信号, 且  $\sigma(t) = i$  表示第  $i$  个子系统在  $t$  时刻被激活,  $\omega(t) \in R^q$  为外部干扰, 且系数矩阵  $A_{\sigma(t)} \in R^{n \times n}$ ,  $A_{1\sigma(t)} \in R^{n \times n}$ ,  $A_{2\sigma(t)} \in R^{n \times n}$ ,  $B_{1\sigma(t)} \in R^{n \times p}$ ,  $B_{2\sigma(t)} \in R^{n \times q}$ ,  $C_{\sigma(t)} \in R^{m \times n}$ ,  $C_{1\sigma(t)} \in R^{m \times p}$ ,  $C_{2\sigma(t)} \in R^{m \times q}$ ,  $C = [C_1, C_2, \dots, C_l] \in R^{l \times n}$ ,  $D \in R^{n \times l}$ ,  $d$  为正实数,  $d_1(t)$ ,  $d_2(t)$  表示时变的状态时滞, 并且时滞变化率满足  $0 < \dot{d}_1(t) \leq h_1 < 1$ ,  $0 < \dot{d}_2(t) \leq h_2 < 1$ 。  $\Delta A_{\sigma(t)}$ ,  $\Delta A_{1\sigma(t)}$ ,  $\Delta A_{2\sigma(t)}$  为参数不确定性矩阵, 且满足关系式  $[\Delta A_{\sigma(t)}(t), \Delta A_{1\sigma(t)}(t), \Delta A_{2\sigma(t)}(t)] = N_{\sigma(t)} F_{\sigma(t)}(t) [G_{\sigma(t)}, G_{1\sigma(t)}, G_{2\sigma(t)}]$ 。  $N_{\sigma(t)} \in R^{n \times n}$ ,  $G_{\sigma(t)} \in R^{n \times n}$ ,  $G_{1\sigma(t)} \in R^{n \times n}$ ,  $G_{2\sigma(t)} \in R^{n \times n}$ ,  $F_{\sigma(t)}(t)$  是具有 Lebesgue 可测的未知矩阵, 满足  $F_{\sigma(t)}^T(t) F_{\sigma(t)}(t) \leq I$ ;  $f(\mu)$  表示非线性向量, 且位于有限的霍尔维茨角域内,

$$f_j(\bullet) \in K_{[0, k_j]} = \{f_j(\mu_j) | f_j(0) = 0, 0 < \mu_j, f_j(\mu_j) \leq \lambda_j \mu_j^2, (\mu_j \neq 0)\}, j = 1, 2, \dots, l \quad (2)$$

其中,  $\lambda_1, \lambda_2, \dots, \lambda_l$  为常数, 记  $\lambda = \text{diag}\{\lambda_1, \lambda_2, \dots, \lambda_l\}$ ,  $\mu(t) = (\mu_1(t), \mu_2(t), \dots, \mu_n(t))^T \in R^n$ ,  $f(\mu) = (f_1(\mu_1), f_2(\mu_2), \dots, f_l(\mu_l))^T \in R^l$

设计带有记忆的输出反馈控制器为  $u(t) = K_{\sigma(t)} x(t) + K_{1\sigma(t)} x(t - d_1(t)) + K_{2\sigma(t)} x(t - d_2(t))$  且  $K_{\sigma(t)} \in R^{p \times n}$ ,  $K_{1\sigma(t)} \in R^{p \times n}$ ,  $K_{2\sigma(t)} \in R^{p \times n}$ 。

系统(1)的闭环系统:

$$\begin{cases} E\dot{x}(t) = \left( A_{\sigma(t)} + N_{\sigma(t)} F_{\sigma(t)}(t) G_{\sigma(t)} + B_{1\sigma(t)} K_{\sigma(t)} \right) x(t) \\ \quad + \left( A_{1\sigma(t)} + N_{\sigma(t)} F_{\sigma(t)}(t) G_{1\sigma(t)} + B_{1\sigma(t)} K_{1\sigma(t)} \right) x(t - d_1(t)) \\ \quad + \left( A_{2\sigma(t)} + N_{\sigma(t)} F_{\sigma(t)}(t) G_{2\sigma(t)} + B_{1\sigma(t)} K_{2\sigma(t)} \right) x(t - d_2(t)) + B_{2\sigma(t)} \omega(t) + Df(\mu(t)) \\ z(t) = \left( C_{\sigma(t)} + C_{1\sigma(t)} K_{\sigma(t)} \right) x(t) + C_{1\sigma(t)} K_{1\sigma(t)} x(t - d_1(t)) + C_{1\sigma(t)} K_{2\sigma(t)} x(t - d_2(t)) + C_{2\sigma(t)} \omega(t) \\ x(t) = \varphi(t), \varphi \in C[-d, 0] \end{cases} \quad (3)$$

记  $\bar{A}_{\sigma(t)} = A_{\sigma(t)} + N_{\sigma(t)} F_{\sigma(t)}(t) G_{\sigma(t)}$ ,  $\bar{A}_{1\sigma(t)} = A_{1\sigma(t)} + N_{\sigma(t)} F_{\sigma(t)}(t) G_{1\sigma(t)}$ ,  $\bar{A}_{2\sigma(t)} = A_{2\sigma(t)} + N_{\sigma(t)} F_{\sigma(t)}(t) G_{2\sigma(t)}$  则系统(3)变为:

$$\begin{cases} E\dot{x}(t) = \left( \bar{A}_{\sigma(t)} + B_{1\sigma(t)} K_{\sigma(t)} \right) x(t) + \left( \bar{A}_{1\sigma(t)} + B_{1\sigma(t)} K_{1\sigma(t)} x(t - d_1(t)) \right) \\ \quad + \left( \bar{A}_{2\sigma(t)} + B_{1\sigma(t)} K_{2\sigma(t)} x(t - d_2(t)) \right) + B_{2\sigma(t)} \omega(t) + Df(\mu(t)) \\ z(t) = \left( C_{\sigma(t)} + C_{1\sigma(t)} K_{\sigma(t)} \right) x(t) + C_{1\sigma(t)} K_{1\sigma(t)} x(t - d_1(t)) + C_{1\sigma(t)} K_{2\sigma(t)} x(t - d_2(t)) + C_{2\sigma(t)} \omega(t) \\ x(t) = \varphi(t), \varphi \in C[-d, 0] \end{cases} \quad (4)$$

**定义 1:** 使得广义 Lurie 不确定切换系统(1)具有鲁棒无源的。如果:

- 1) 当外部扰动输入  $\omega(t) \equiv 0$  时, 闭环系统是渐近稳定的。
- 2) 在系统初始条件  $\varphi(t) \equiv 0, t \in [-d, 0]$  时, 对于所有非零的  $\omega$ , 使得无源不等式成立  $\dot{V}(x(t), t) \leq \omega^T(t)z(t)$ ,  $\omega \in L_2[0, \infty]$ ; 若无源不等式换为严格不等式, 则称广义 Lurie 切换不确定性系统(1)是严格无源的。

在分析和推导的过程中, 我们会用到以下的引理。

**引理 1 [26]:** 给定适当维数的矩阵  $Y$ ,  $D$  和  $E$ , 其中  $Y$  是对称的, 则  $Y + DFE + E^T F^T D^T < 0$ , 对所有满足  $F^T F \leq I$  的矩阵成立, 当且仅当存在一个常数  $\varepsilon > 0$ , 使得  $Y + \varepsilon DD^T + \varepsilon^{-1} E^T E < 0$ 。

**引理 2 [27] (Schur 补引理):** 对给定的对称矩阵  $S = \begin{bmatrix} S_{11} & S_{12} \\ S_{21} & S_{22} \end{bmatrix}$ , 其中  $S_{11} \in R^{r \times r}$ , 以下三个条件是等价的:

- (I)  $S < 0$ ;
- (II)  $S_{11} < 0, S_{22} - S_{21}S_{11}^{-1}S_{12} < 0$ ;
- (III)  $S_{22} < 0, S_{11} - S_{12}S_{22}^{-1}S_{21} < 0$ 。

**引理 3 [27]:** 对于任意适当维数的矩阵  $X$ ,  $Y$ , 且存在一个常数  $\varepsilon > 0$ , 有

$$X^T Y + Y^T X \leq \varepsilon X^T X + \frac{1}{\varepsilon} Y^T Y$$

### 3. 带记忆的鲁棒无源性分析

**定理 1:** 对于闭环系统(4)如果  $C_{2i} + C_{2i}^T > 0$ ,  $E^T P = P^T E \geq 0$  存在可逆矩阵  $P \in P^{n \times n}$ ,  $K_{\sigma(t)} \in R^{p \times n}$ ,  $K_{1\sigma(t)} \in R^{p \times n}$ ,  $K_{2\sigma(t)} \in R^{p \times n}$  和矩阵  $Q_1 = Q_1^T > 0$ ,  $Q_2 = Q_2^T > 0$ , 且  $Q_1^{n \times n}, Q_2 \in R^{n \times n}$  正实数  $h_1 < 1, h_2 < 1$  使得下面不等式成立:

$$\begin{bmatrix} \Xi & P\bar{A}_{1i} + PB_{1i}K_{1i} & P\bar{A}_{2i} + PB_{2i}K_{2i} & PB_{2i} - C_i^T - K_i^T C_i^T \\ * & -(1-h_1)Q_1 & 0 & -K_{1i}^T C_{1i}^T \\ * & * & -(1-h_2)Q_2 & -K_{2i}^T C_{2i}^T \\ * & * & * & -C_{2i} - C_{2i}^T \end{bmatrix} < 0 \quad (5)$$

其中  $\Xi = P\bar{A}_i + \bar{A}_i^T P + PB_{1i}B_{1i}^T P + K_i^T K_i + Q_1 + Q_2 + C^T \lambda^T \lambda C + PDD^T P$ , \* 表示关于对角线的对称矩阵部分, 则此时 Lurie 切换广义系统(1)在任意切换规则下对所有扰动是渐进稳定且严格无源的。

**证明:** 先证在外部扰动  $\omega(t) \equiv 0$  时, 闭环系统(4)是渐近稳定的。

构造 Lyapunov-Krasovskii 泛函如下

$$\begin{aligned} V_1(x(t), t) = & x^T(t)E^T Px(t) + \int_{t-d_1(t)}^t x^T(s)Q_1 x(s)ds \\ & + \int_{t-d_2(t)}^t x^T(s)Q_2 x(s)ds \end{aligned} \quad (6)$$

其中  $P \in R^{n \times n}$ ,  $Q_1 \in R^{n \times n}$ ,  $Q_2 \in R^{n \times n}$ 。记  $\sigma(t) = i, (i \in \bar{N})$ , 及  $\xi(t) = (x^T(t), x^T(t-d_1(t)), x^T(t-d_2(t)))^T$ ,  $\eta(t) = (x^T(t), x^T(t-d_1(t)), x^T(t-d_2(t)), \omega^T(t))^T$

对  $V_1(x(t), t)$  沿闭环系统(4)求导, 可以得到

$$\begin{aligned}
& \dot{V}_1(x(t), t) \Big|_{(4)} \\
&= \dot{x}^T(t) E^T P x(t) + x^T(t) E^T P \dot{x}(t) + x^T(t) Q_1 x(t) - (1 - \dot{d}_1(t)) x^T(t - d_1(t)) Q_1 x(t - d_1(t)) \\
&\quad + x^T(t) Q_2 x(t) - (1 - \dot{d}_2(t)) x^T(t - d_2(t)) Q_2 x(t - d_2(t)) \\
&= (E \dot{x}(t))^T P x(t) + x^T(t) P^T(E \dot{x}(t)) + x^T(t) Q_1 x(t) - (1 - \dot{d}_1(t)) x^T(t - d_1(t)) Q_1 x(t - d_1(t)) \\
&\quad + x^T(t) Q_2 x(t) - (1 - \dot{d}_2(t)) x^T(t - d_2(t)) Q_2 x(t - d_2(t)) \\
&= \left[ (\bar{A}_i + B_{li} K_i) x(t) + (\bar{A}_{li} + B_{li} K_{li}) x(t - d_1(t)) + (\bar{A}_{2i} + B_{li} K_{2i}) x(t - d_2(t)) + B_{2i} \omega(t) + Df(\mu(t)) \right]^T P x(t) \\
&\quad + x^T(t) P \left[ (\bar{A}_i + B_{li} K_i) x(t) + (\bar{A}_{li} + B_{li} K_{li}) x(t - d_1(t)) + (\bar{A}_{2i} + B_{li} K_{2i}) x(t - d_2(t)) + B_{2i} \omega(t) + Df(\mu(t)) \right] \\
&\quad + x^T(t) Q_1 x(t) - (1 - \dot{d}_1(t)) x^T(t - d_1(t)) Q_1 x(t - d_1(t)) + x^T(t) Q_2 x(t) - (1 - \dot{d}_2(t)) x^T(t - d_2(t)) Q_2 x(t - d_2(t)) \\
&= f^T(\mu(t)) D^T P x(t) + \omega^T(t) B_{2i}^T P x(t) + x^T(t - d_2(t)) (K_{2i}^T B_{li}^T + \bar{A}_{2i}^T) P x(t) \\
&\quad + x^T(t - d_1(t)) (K_{li}^T B_{li}^T + \bar{A}_{li}^T) P x(t) + x^T(t) (K_i^T B_{li}^T + \bar{A}_i^T) P x(t) \\
&\quad + x^T(t) (P \bar{A}_i + B_{li} K_i) x(t) + x^T(t) (P \bar{A}_{li} + B_{li} K_{li}) x(t - d_1(t)) \\
&\quad + x^T(t) (P \bar{A}_{2i} + B_{li} K_{2i}) x(t - d_2(t)) + x^T(t) P B_{2i} \omega(t) + x^T(t) P Df(\mu(t)) \\
&\quad + x^T(t) Q_1 x(t) - (1 - \dot{d}_1(t)) x^T(t - d_1(t)) Q_1 x(t - d_1(t)) + x^T(t) Q_2 x(t) \\
&\quad - (1 - \dot{d}_2(t)) x^T(t - d_2(t)) Q_2 x(t - d_2(t)) \\
&= x^T(t) (P \bar{A}_i + \bar{A}_i^T P + P B_{li} K_i + K_i^T B_{li}^T P + Q_1 + Q_2) x(t) + x^T(t - d_1(t)) (\bar{A}_{li}^T P + K_{li}^T B_{li}^T P) x(t) \\
&\quad + x^T(t) (P \bar{A}_{li} + P B_{li} K_{li}) x(t - d_1(t)) + x^T(t - d_2(t)) (\bar{A}_{2i}^T P + K_{2i}^T B_{li}^T P) x(t) \\
&\quad + x^T(t) (P \bar{A}_{2i} + P B_{li} K_{2i}) x(t - d_1(t)) - (1 - \dot{d}_1(t)) x^T(t - d_1(t)) Q_1 x(t - d_1(t)) \\
&\quad - (1 - \dot{d}_2(t)) x^T(t - d_2(t)) Q_2 x(t - d_2(t)) + x^T(t) P B_{2i} \omega(t) \\
&\quad + \omega^T(t) B_{2i}^T P x(t) + x^T(t) P Df(\mu(t)) + f^T(\mu(t)) D^T P x(t)
\end{aligned} \tag{7}$$

由(2)式霍尔维茨角域可以等价表示为  $f_j(\mu(t))(f_j(\mu(t)) - \lambda_j c_j x(t)) \leq 0, j = 1, 2, \dots, l$ , 可以导出

$$f^T(\mu(t)) f(\mu(t)) \leq x^T(t) C^T \tilde{\lambda}^T \tilde{\lambda} C x(t) \tag{8}$$

所以由引理 3 及(8)式可以得到

$$\begin{aligned}
& x^T(t) P D f(\mu(t)) + f^T(\mu(t)) D^T P x(t) \\
& \leq f^T(\mu(t)) f(\mu(t)) + x^T(t) P D D^T P x(t) \\
& \leq x^T(t) C^T \tilde{\lambda}^T \tilde{\lambda} C x(t) + x^T(t) P D D^T P x(t)
\end{aligned} \tag{9}$$

所以由  $0 < \dot{d}_1(t) \leq h_1 < 1, 0 < \dot{d}_2(t) \leq h_2 < 1$  以及(9)式可以得到

$$\begin{aligned}
& \dot{V}_1(x(t), t) \Big|_{(4)} \leq x^T(t) (P \bar{A}_i + \bar{A}_i^T P + P B_{li} K_i + K_i^T B_{li}^T P + Q_1 + Q_2 + C^T \tilde{\lambda}^T \tilde{\lambda} C + P D D^T P) x(t) \\
&\quad + x^T(t - d_1(t)) (\bar{A}_{li}^T P + K_{li}^T B_{li}^T P) x(t) + x^T(t) (P \bar{A}_{li} + P B_{li} K_{li}) x(t - d_1(t)) \\
&\quad + x^T(t - d_2(t)) (\bar{A}_{2i}^T P + K_{2i}^T B_{li}^T P) x(t) + x^T(t) (P \bar{A}_{2i} + P B_{li} K_{2i}) x(t - d_1(t)) \\
&\quad - (1 - h_1) x^T(t - d_1(t)) Q_1 x(t - d_1(t)) - (1 - h_2) x^T(t - d_2(t)) Q_2 x(t - d_2(t)) \\
&\quad + x^T(t) P B_{2i} \omega(t) + \omega^T(t) B_{2i}^T P x(t)
\end{aligned} \tag{10}$$

由引理 3 可得

$$x^T(t)PB_{li}K_i x(t) + x^T(t)K_i^T B_{li}^T P x(t) \leq x^T(t)PB_{li}B_{li}^T P x(t) + x^T(t)K_i^T K_i x(t) \quad (11)$$

将(11)式代入(10)式得

$$\begin{aligned} \dot{V}(x(t), t) \Big|_{(4)} &\leq x^T(t)(P\bar{A}_i + \bar{A}_i^T P + PB_{li}B_{li}^T P + K_i^T K_i + Q_1 + Q_2 + C^T \hat{\lambda}^T \hat{\lambda} C + PDD^T P)x(t) \\ &+ x^T(t-d_1(t))(\bar{A}_{li}^T P + K_{li}^T B_{li}^T P)x(t) + x^T(t)(P\bar{A}_{li} + PB_{li}K_{li})x(t-d_1(t)) \\ &+ x^T(t-d_2(t))(\bar{A}_{2i}^T P + K_{2i}^T B_{li}^T P)x(t) + x^T(t)(P\bar{A}_{2i} + PB_{li}K_{2i})x(t-d_2(t)) \\ &- (1-h_1)x^T(t-d_1(t))Q_1 x(t-d_1(t)) - (1-h_2)x^T(t-d_2(t))Q_2 x(t-d_2(t)) \\ &+ x^T(t)PB_{2i}\omega(t) + \omega^T(t)B_{2i}^T P x(t) \end{aligned} \quad (12)$$

记

$$\xi(t) = (x^T(t), x^T(t-d_1(t)), x^T(t-d_2(t)))^T$$

所以

$$\dot{V}_1(x(t), t) \Big|_{(4)} \leq \xi^T(t)H_1\xi(t)$$

其中

$$H_1 = \begin{bmatrix} \Xi & P\bar{A}_{li} + PB_{li}K_{li} & P\bar{A}_{2i} + PB_{li}K_{2i} \\ * & -(1-h_1)Q_1 & 0 \\ * & * & -(1-h_2)Q_2 \end{bmatrix}$$

$$\Xi = P\bar{A}_i + \bar{A}_i^T P + PB_{li}B_{li}^T P + K_i^T K_i + Q_1 + Q_2 + C^T \hat{\lambda}^T \hat{\lambda} C + PDD^T P$$

由(5)式及 Schur 补引理知,  $H_1 < 0$  所以  $\dot{V}_1(x(t), t) < 0$ , 通过 Lyapunov 稳定性理论得到闭环(4)是渐近稳定的。

下证闭环系统(4)满足的无源性。

$$\begin{aligned} &\dot{V}_1(x(t), t) - \omega^T(t)z(t) \\ &= \dot{V}_1(x(t), t) - \omega^T(t)z(t) - z^T(t)\omega(t) + z^T(t)\omega(t) \\ &= x^T(t)(P\bar{A}_i + \bar{A}_i^T P + PB_{li}B_{li}^T P + K_i^T K_i + Q_1 + Q_2 + C^T \hat{\lambda}^T \hat{\lambda} C + PDD^T P)x(t) \\ &+ x^T(t-d_1(t))(\bar{A}_{li}^T P + K_{li}^T B_{li}^T P)x(t) + x^T(t)(P\bar{A}_{li} + PB_{li}K_{li})x(t-d_1(t)) \\ &+ x^T(t-d_2(t))(\bar{A}_{2i}^T P + K_{2i}^T B_{li}^T P)x(t) + x^T(t)(P\bar{A}_{2i} + PB_{li}K_{2i})x(t-d_2(t)) \\ &- (1-h_1)x^T(t-d_1(t))Q_1 x(t-d_1(t)) - (1-h_2)x^T(t-d_2(t))Q_2 x(t-d_2(t)) \\ &+ x^T(t)PB_{2i}\omega(t) + \omega^T(t)B_{2i}^T P x(t) - \omega^T(t)((C_i + C_i K_i)x(t) + C_{li}K_{li}x(t-d_1(t))) \\ &+ C_{li}K_{2i}x(t-d_2(t)) + C_{2i}\omega(t) - ((C_i + C_i K_i)x(t) + C_{li}K_{li}x(t-d_1(t))) \\ &+ C_{li}K_{2i}x(t-d_2(t)) + C_{2i}\omega(t))^T \omega(t) + z^T(t)\omega(t) \\ &= x^T(t)(P\bar{A}_i + \bar{A}_i^T P + PB_{li}B_{li}^T P + K_i^T K_i + Q_1 + Q_2 + C^T \hat{\lambda}^T \hat{\lambda} C + PDD^T P)x(t) \\ &+ x^T(t-d_1(t))(\bar{A}_{li}^T P + K_{li}^T B_{li}^T P)x(t) + x^T(t)(P\bar{A}_{li} + PB_{li}K_{li})x(t-d_1(t)) \\ &+ x^T(t-d_2(t))(\bar{A}_{2i}^T P + K_{2i}^T B_{li}^T P)x(t) + x^T(t)(P\bar{A}_{2i} + PB_{li}K_{2i})x(t-d_2(t)) \\ &- (1-h_1)x^T(t-d_1(t))Q_1 x(t-d_1(t)) - (1-h_2)x^T(t-d_2(t))Q_2 x(t-d_2(t)) \end{aligned}$$

$$\begin{aligned}
& + x^T(t) \left( PB_{2i} - K_i^T C_i^T - C_i^T \right) \omega(t) + \omega^T(t) \left( B_{2i}^T P - C_i - C_i K_i \right) x(t) \\
& - x^T(t - d_1(t)) K_{1i}^T C_{1i}^T \omega(t) - x^T(t - d_2(t)) K_{1i}^T C_{1i}^T \omega(t) \\
& - \omega^T(t) C_{1i} K_{1i} x(t - d_1(t)) - \omega^T(t) C_{1i} K_{2i} x(t - d_2(t)) \\
& + \omega^T(t) (-C_{2i} - C_{2i}^T) \omega(t) \\
& = \eta^T(t) H_2 \eta(t) + z^T(t) \omega(t)
\end{aligned}$$

其中

$$H_2 = \begin{bmatrix} \Xi & P\bar{A}_{1i} + PB_{1i}K_{1i} & P\bar{A}_{2i} + PB_{1i}K_{2i} & PB_{2i} - C_i^T - K_i^T C_i^T \\ * & -(1-h_1)Q_1 & 0 & -K_{1i}^T C_{1i}^T \\ * & * & -(1-h_2)Q_2 & -K_{1i}^T C_{2i}^T \\ * & * & * & -C_{2i} - C_{2i}^T \end{bmatrix}$$

$$\Xi = P\bar{A}_i + \bar{A}_i^T P + PB_{1i}B_{1i}^T P + K_i^T K_i + Q_1 + Q_2 + C^T \tilde{\lambda}^T \tilde{\lambda} C + P D D^T P,$$

$$\eta(t) = (x^T(t), x^T(t - d_1(t)), x^T(t - d_2(t)), \omega^T(t))^T$$

而根据矩阵不等式(5)可以得到  $H_2 < 0$  则  $\dot{V}_1(x) - 2\omega^T(t)z(t) < 0$  取  $V(x) = \frac{1}{2}V_1(x)$ , 此时满足定义 1,

所以 Lurie 切换广义系统(1)是渐进稳定且严格无源的。

#### 4. 带有记忆的无源控制器设计

**定理 2:** 如果  $C_{2i} + C_{2i}^T > 0$ ,  $E^T P = P^T E \geq 0$  对于给定标量  $\varepsilon > 0$ ,  $0 < h_1 < 1$ ,  $0 < h_2 < 1$  系统(1)是具有鲁棒无源可切换镇定的。如果存在非奇异矩阵  $M_i \in R^{p \times n}$  ( $i = 1, 2, \dots$ ),  $X^T = X > 0$ ,  $S_1 \in R^{n \times n}$ ,  $S_2 \in R^{n \times n}$  有下列矩阵不等式成立:

$$\begin{bmatrix} A_i X + X^T A_i^T + S_1 + S_2 & A_{1i} X + B_{1i} M_{1i} & A_{2i} X + B_{1i} M_{2i} & B_{1i} & B_{2i} - M_i^T C_i^T - X^T C_i^T & M_i^T & \varepsilon^{-1} N_i & \varepsilon X^T G_i^T & X^T C^T \tilde{\lambda}^T & D \\ * & -(1-h_1)S_1 & 0 & 0 & -M_{1i}^T C_{1i}^T & 0 & 0 & \varepsilon X^T G_{1i}^T & 0 & 0 \\ * & * & -(1-h_2)S_2 & 0 & -M_{1i}^T C_{2i}^T & 0 & 0 & \varepsilon X^T G_{2i}^T & 0 & 0 \\ * & * & * & -I & 0 & 0 & 0 & 0 & 0 & 0 \\ * & * & * & * & -C_{2i} - C_{2i}^T & 0 & 0 & 0 & 0 & 0 \\ * & * & * & * & * & -I & 0 & 0 & 0 & 0 \\ * & * & * & * & * & * & -I & 0 & 0 & 0 \\ * & * & * & * & * & * & * & -I & 0 & 0 \\ * & * & * & * & * & * & * & * & -I & 0 \\ * & * & * & * & * & * & * & * & * & -I \end{bmatrix} < 0 \quad (13)$$

使得控制增益矩阵为  $K_i = M_i X_i^{-1}$ ,  $u(t) = K_{\sigma(t)} x(t) + K_{1\sigma(t)} x(t - d_1(t)) + K_{2\sigma(t)} x(t - d_2(t))$  且  $K_{\sigma(t)} \in R^{p \times n}$ ,  $K_{1\sigma(t)} \in R^{p \times n}$ ,  $K_{2\sigma(t)} \in R^{p \times n}$  是系统(1)的鲁棒无源记忆反馈控制器。

**证明:** 由定理 1 知,

$$\begin{bmatrix} \Xi & P\bar{A}_{1i} + PB_{1i}K_{1i} & P\bar{A}_{2i} + PB_{1i}K_{2i} & PB_{2i} - C_i^T - K_i^T C_i^T \\ * & -(1-h_1)Q_1 & 0 & -K_{1i}^T C_{1i}^T \\ * & * & -(1-h_2)Q_2 & -K_{1i}^T C_{2i}^T \\ * & * & * & -C_{2i} - C_{2i}^T \end{bmatrix} < 0 \quad (14)$$

$$\Xi = P\bar{A}_i + \bar{A}_i^T P + PB_{1i}B_{1i}^T P + K_i^T K_i + Q_1 + Q_2 + C^T \tilde{\lambda}^T \tilde{\lambda} C + P D D^T P$$

将不确定项  $[\Delta A_i, \Delta A_{li}, \Delta A_{2i}] = N_i F_i(t) [G_i, G_{li}, G_{2i}]$ ,  $\bar{A}_i = A_i + N_i F_i(t) G_i$ ,  $\bar{A}_{li} = A_{li} + N_i F_i(t) G_{li}$ ,  $\bar{A}_{2i} = A_{2i} + N_i F_i(t) G_{2i}$  代入(14)式得

$$\begin{bmatrix} \Xi_1 + PN_i F_i(t) G_i + G_i^T F_i^T(t) N_i^T P & PA_{li} + PN_i F_i(t) G_{li} + PB_{li} K_{li} & PA_{2i} + PN_i F_i(t) G_{2i} + PB_{li} K_{2i} & PB_{2i} - C_i^T - K_i^T C_i^T \\ * & -(1-h_1) Q_1 & 0 & -K_{li}^T C_{li}^T \\ * & * & -(1-h_2) Q_2 & -K_{li}^T C_{2i}^T \\ * & * & * & -C_{2i} - C_{2i}^T \end{bmatrix} < 0 \quad (15)$$

此时

$$\Xi_1 = PA_i + A_i^T P + PB_{li} B_{li}^T P + K_i^T K_i + Q_1 + Q_2 + C^T \hat{\lambda}^T \hat{\lambda} C + P D D^T P$$

记

$$H_3 = \begin{bmatrix} \Xi_1 & PA_{li} + PB_{li} K_{li} & PA_{2i} + PB_{li} K_{2i} & PB_{2i} - C_i^T - K_i^T C_i^T \\ * & -(1-h_1) Q_1 & 0 & -K_{li}^T C_{li}^T \\ * & * & -(1-h_2) Q_2 & -K_{li}^T C_{2i}^T \\ * & * & * & -C_{2i} - C_{2i}^T \end{bmatrix}$$

则式(15)等价为

$$H_3 + \begin{bmatrix} G_i^T \\ G_{li}^T \\ G_{2i}^T \\ 0 \end{bmatrix} F_i^T(t) \begin{bmatrix} N_i^T P & 0 & 0 & 0 \end{bmatrix} + \begin{bmatrix} PN_i \\ 0 \\ 0 \\ 0 \end{bmatrix} F_i(t) [G_i \quad G_{li} \quad G_{2i} \quad 0] < 0 \quad (16)$$

由引理 1 可知, 要使不等式(16)成立, 当且仅存在一个常数  $\varepsilon > 0$

$$H_3 + \varepsilon^2 [G_i \quad G_{li} \quad G_{2i} \quad 0]^T [G_i \quad G_{li} \quad G_{2i} \quad 0] + \varepsilon^{-2} \begin{bmatrix} PN_i \\ 0 \\ 0 \\ 0 \end{bmatrix} \begin{bmatrix} PN_i \\ 0 \\ 0 \\ 0 \end{bmatrix}^T < 0 \quad (17)$$

整理(17)式可得

$$\begin{bmatrix} \Xi_1 + \varepsilon^2 G_i^T G_i + \varepsilon^{-2} PN_i N_i^T P & PA_{li} + PB_{li} K_{li} + \varepsilon^2 G_i^T G_{li} & PA_{2i} + PB_{li} K_{2i} + \varepsilon^2 G_i^T G_{2i} & PB_{2i} - C_i^T - K_i^T C_i^T \\ * & -(1-h_1) Q_1 + \varepsilon^2 G_{li}^T G_{li} & \varepsilon^2 G_{li}^T G_{2i} & -K_{li}^T C_{li}^T \\ * & * & -(1-h_2) Q_2 + \varepsilon^2 G_{2i}^T G_{2i} & -K_{li}^T C_{2i}^T \\ * & * & * & -C_{2i} - C_{2i}^T \end{bmatrix} < 0 \quad (18)$$

由 Schur 补引理知(18)式等价为

$$\begin{bmatrix} PA_i + A_i^T P + Q_1 + Q_2 & PA_{li} + PB_{li} K_{li} & PA_{2i} + PB_{li} K_{2i} & PB_{li} & PB_{2i} - K_i^T C_i^T - C_i^T & K_i^T & \varepsilon^{-1} PN_i & \varepsilon G_i^T & C^T \hat{\lambda}^T & PD \\ * & -(1-h_1) Q_1 & 0 & 0 & -K_{li}^T C_{li}^T & 0 & 0 & \varepsilon G_{li}^T & 0 & 0 \\ * & * & -(1-h_2) Q_2 & 0 & -K_{li}^T C_{2i}^T & 0 & 0 & \varepsilon G_{2i}^T & 0 & 0 \\ * & * & * & -I & 0 & 0 & 0 & 0 & 0 & 0 \\ * & * & * & * & -C_{2i} - C_{2i}^T & 0 & 0 & 0 & 0 & 0 \\ * & * & * & * & * & -I & 0 & 0 & 0 & 0 \\ * & * & * & * & * & * & -I & 0 & 0 & 0 \\ * & * & * & * & * & * & * & -I & 0 & 0 \\ * & * & * & * & * & * & * & * & -I & 0 \\ * & * & * & * & * & * & * & * & * & -I \end{bmatrix} < 0 \quad (19)$$

记  $X = P^{-1}$ ,  $S_1 = P^{-T}Q_1P^{-1}$ ,  $S_2 = P^{-T}Q_2P^{-1}$ ,  $K_i = M_iX_i^{-1}$ , 其中  $M_i \in R^{p \times n}$

对不等式(19)左乘  $diag\{P^{-T}, P^{-T}, P^{-T}, I, I, I, I, I, I, I\}$  右乘  $diag\{P^{-1}, P^{-1}, P^{-1}, I, I, I, I, I, I, I\}$  得到等价的线性化不等式(13), 定理 2 证毕。

## 5. 数值仿真

考虑以下系统

$$\begin{cases} \dot{Ex}(t) = (A_{\sigma(t)} + \Delta A_{\sigma(t)}(t))x(t) + (A_{1\sigma(t)} + \Delta A_{1\sigma(t)}(t))x(t-d_1(t)) \\ \quad + (A_{2\sigma(t)} + \Delta A_{2\sigma(t)}(t))x(t-d_2(t)) + B_{1\sigma(t)}u(t) + B_{2\sigma(t)}\omega(t) + Df(\mu(t)) \\ z(t) = C_{\sigma(t)}x(t) + C_{1\sigma(t)}u(t) + C_{2\sigma(t)}\omega(t) \\ \mu(t) = Cx(t) \\ x(t) = \varphi(t) \in C([-d, 0], R^n) \end{cases}$$

系数矩阵如下:

$$\begin{aligned} A_1 &= \begin{bmatrix} -4.5 & -0.5 \\ 1 & -3.5 \end{bmatrix}, \quad A_2 = \begin{bmatrix} -4.5 & -0.5 \\ 1 & -3.5 \end{bmatrix}, \quad A_{11} = \begin{bmatrix} -2 & 0.3 \\ -0.3 & 0.1 \end{bmatrix}, \quad A_{12} = \begin{bmatrix} 0.1 & 0.1 \\ -0.1 & 0.1 \end{bmatrix}, \quad A_{21} = \begin{bmatrix} -2 & 0.4 \\ -0.3 & 0.1 \end{bmatrix}, \\ A_{22} &= \begin{bmatrix} 0.1 & 0.3 \\ -0.1 & 0.1 \end{bmatrix}, \quad B_{11} = \begin{bmatrix} -0.1 & 0.1 \\ 0.1 & 0.5 \end{bmatrix}, \quad B_{12} = \begin{bmatrix} 0.9 & 0.1 \\ -0.2 & 0 \end{bmatrix}, \quad B_{21} = \begin{bmatrix} -0.1 & -0.1 \\ 0.1 & 0.5 \end{bmatrix}, \quad B_{22} = \begin{bmatrix} 0.8 & 0.1 \\ -0.2 & 0 \end{bmatrix}, \\ C_1 &= \begin{bmatrix} -0.1 & 0.2 \\ 0.1 & 0.2 \end{bmatrix}, \quad C_2 = \begin{bmatrix} -0.3 & 0.13 \\ -0.1 & 0.1 \end{bmatrix}, \quad C_{11} = \begin{bmatrix} -0.1 & 0.1 \\ 0.1 & 0.2 \end{bmatrix}, \quad C_{12} = \begin{bmatrix} 0.1 & 0.1 \\ -0.1 & 8 \end{bmatrix}, \quad C_{21} = \begin{bmatrix} -0.1 & 0.3 \\ 0.1 & 0.2 \end{bmatrix}, \\ C_{22} &= \begin{bmatrix} -0.4 & 0.13 \\ -0.1 & 0.1 \end{bmatrix}, \quad D_1 = \begin{bmatrix} -0.4 & -0.5 \\ 0.1 & -2 \end{bmatrix}, \quad D_2 = \begin{bmatrix} -0.4 & -0.5 \\ 0.4 & -2 \end{bmatrix}, \quad G_1 = \begin{bmatrix} 1.6 & -1 \\ 0.2 & 0 \end{bmatrix}, \quad G_2 = \begin{bmatrix} 1.57 & -1 \\ 0.2 & 0 \end{bmatrix}, \\ G_{11} &= \begin{bmatrix} 0 & -0.1 \\ -0.1 & 0.2 \end{bmatrix}, \quad G_{12} = \begin{bmatrix} -9 & -0.1 \\ -0.1 & 0.2 \end{bmatrix}, \quad C_{21} = \begin{bmatrix} -0.1 & 0.1 \\ 0.2 & 0.2 \end{bmatrix}, \quad C_{22} = \begin{bmatrix} 0.13 & 0.1 \\ -0.1 & 8 \end{bmatrix}, \quad N_1 = \begin{bmatrix} 0.1 & -0.1 \\ 0.3 & 0.1 \end{bmatrix}, \\ N_2 &= \begin{bmatrix} 0.15 & -0.1 \\ 0.3 & 0.1 \end{bmatrix}, \quad \hat{\lambda}_1 = \begin{bmatrix} 0.5 & 0.1 \\ 0 & 1 \end{bmatrix}, \quad \hat{\lambda}_2 = \begin{bmatrix} 0.5 & 0.1 \\ 0.1 & 1 \end{bmatrix} \end{aligned}$$

给定  $\varepsilon = 0.2$ ,  $h_1 = 0.1$ ,  $h_2 = 0.01$  由(13)式及 MATLAB 求出相应的可行解为:

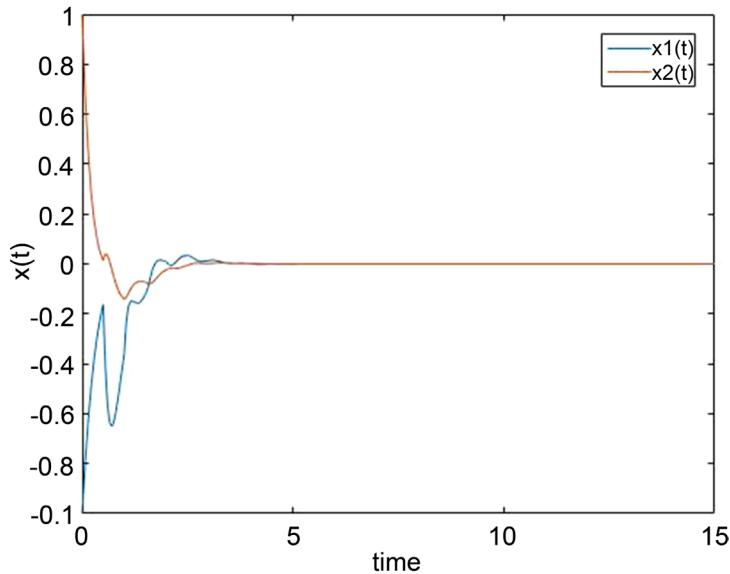

$$\begin{aligned} X_1 &= \begin{bmatrix} 1.3653 & 2.7334 \\ 2.7334 & 17.1041 \end{bmatrix}, \quad X_2 = \begin{bmatrix} 0.8294 & 1.4702 \\ 1.4702 & 13.6065 \end{bmatrix}, \quad M_1 = \begin{bmatrix} -0.2012 & 0.0792 \\ -0.2325 & 0.1076 \end{bmatrix}, \\ M_2 &= \begin{bmatrix} -0.2064 & 0.0587 \\ -0.0066 & 0.0080 \end{bmatrix}, \quad M_{11} = \begin{bmatrix} -0.4291 & -0.0081 \\ -0.5273 & -0.0399 \end{bmatrix}, \quad M_{12} = \begin{bmatrix} -8.7714 & -22.0217 \\ -11.8122 & -22.7827 \end{bmatrix}, \\ M_{21} &= \begin{bmatrix} -0.9305 & 0.0042 \\ -5.6686 & 0.0657 \end{bmatrix}, \quad M_{22} = \begin{bmatrix} 20.2108 & 41.4120 \\ -17.5970 & -32.7827 \end{bmatrix}, \quad S_1 = \begin{bmatrix} 3.5131 & 6.2150 \\ 6.2150 & 34.0292 \end{bmatrix}, \\ S_2 &= \begin{bmatrix} 7.2766 & 15.5920 \\ 15.5920 & 37.2564 \end{bmatrix}, \quad S_{11} = \begin{bmatrix} 1.4766 & 2.1657 \\ 2.1657 & 22.7182 \end{bmatrix}, \quad S_{22} = \begin{bmatrix} 5.1256 & 9.8429 \\ 9.8429 & 24.5751 \end{bmatrix}, \\ P_1 &= \begin{bmatrix} 1.0771 & -0.1721 \\ -0.1721 & 0.0860 \end{bmatrix}, \quad P_2 = \begin{bmatrix} 1.4913 & -0.1611 \\ -0.1611 & 0.0909 \end{bmatrix}, \quad Q_1 = \begin{bmatrix} 2.7794 & -0.3953 \\ -0.3953 & 0.1717 \end{bmatrix}, \end{aligned}$$

$$Q_2 = \begin{bmatrix} 3.7641 & 0.0054 \\ 0.0054 & 0.0295 \end{bmatrix}, \quad Q_{11} = \begin{bmatrix} 2.8330 & -0.3378 \\ -0.3378 & 0.1626 \end{bmatrix}, \quad Q_{22} = \begin{bmatrix} 7.3067 & -0.0017 \\ -0.0017 & 0.0478 \end{bmatrix}$$

$$\text{控制器增益矩阵 } K_1 = \begin{bmatrix} -0.2304 & 0.0415 \\ -0.2689 & 0.0493 \end{bmatrix}, \quad K_2 = \begin{bmatrix} -0.3173 & 0.0386 \\ -0.0112 & 0.0018 \end{bmatrix}, \quad K_{11} = \begin{bmatrix} -0.4608 & 0.0732 \\ -0.5610 & 0.0873 \end{bmatrix},$$

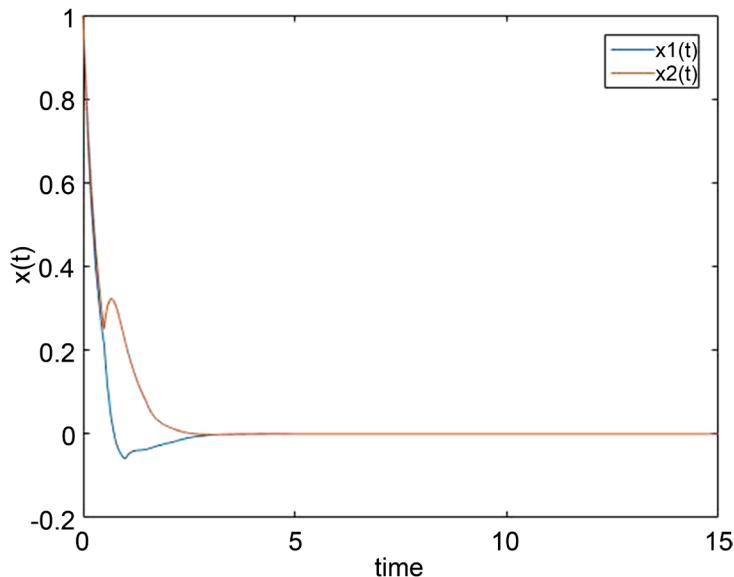

$$K_{12} = \begin{bmatrix} -5.6569 & -0.3835 \\ -8.8012 & 0.0745 \end{bmatrix}, \quad K_{21} = \begin{bmatrix} -1.3883 & 0.1503 \\ -8.4643 & 0.9194 \end{bmatrix}, \quad K_{22} = \begin{bmatrix} 23.4675 & 0.5078 \\ -20.9601 & -0.1445 \end{bmatrix}$$

两子系统的状态轨线对应的仿真曲线图如图 1, 图 2。

**Figure 1.** The state trajectory of subsystem 1

**图 1.** 子系统 1 的状态轨线曲线图

**Figure 2.** The state trajectory of subsystem 2

**图 2.** 子系统 2 的状态轨线曲线图

通过子系统的仿真曲线图, 我们可以很明显的得到: 在选取的切换信号  $\sigma(t)$  作用下, 可以保证系统(1)为整体稳定的。

## 6. 结论

本文综合利用 Lyapunov-Krasovskii 泛函和矩阵不等式方法, 研究了一类不确定性多状态变时滞广义 Lurie 切换系统及带有记忆的反馈控制器的鲁棒无源控制问题, 通过设计具有记忆的反馈控制器, 保证了闭环系统的鲁棒渐近稳定, 同时给出了在严格无源要求下可行解存在的充分性判据, 最后的结果运用线性矩阵不等式的形式给出, 通过数值仿真例子验证了所得结果的可行性。
